Climate Smart roses
We took the plunge

Climate Smart Roses a new cultivation system that has proved effective to 100%. This cultivation system has worked better than we could have faith in our planning.

Our impact on the environment is not = 0 roses using them resources that nature provides in terms of heat and light. Rose trees have a slower growth but we have a stronger rose, large flower, nice and healthy foliage, better and longer life than conventional-grown roses have.

Water absorption is better, no problem with Nick roses. Of course there shall be white brick in the water to keep bacteria away in the water. We do not need to spray something, wish you could candied roses and eat them. Custom Organic fertilizer is used. We use heat pumps for heating. We buy only electricity from wind and water. We have been HOLDING A DIPLOMA for.

We do not need fair trade our roses, we think it is natural that there should be pay for work, health care, holidays and a good working environment. We consider this as a matter of course.
